

SYN-CARDIO-003: A Synthetic Phase III Study of Investigation

al Product CV-9

Protocol version 1.3 (synthetic document for software testing only).

Synopsis

This synthetic protocol describes a randomized, placebo-controlled study of the investigational product CV-9 in adults with heart failure with reduced ejection fraction. CV-9 can prolong the QT interval and raise potassium, so cardiac and electrolyte safety is assessed at screening.

Primary objective: time to first heart failure hospitalisation.

Inclusion Criteria

Participants must meet all of the following criteria:

1. Age 40 years or older.
2. Left ventricular ejection fraction (LVEF) must not exceed 40%.
3. HbA1c below 10%.

Exclusion Criteria

Participants meeting any of the following are excluded:

1. Myocardial infarction within the last 90 days.
2. QTc interval greater than 470 ms.
3. Serum potassium above 5.5 mmol/L.
4. Pregnancy or breastfeeding.
